## Reassessing the Productivity Gains from Trade and FDI Liberalization: An Industry-Level Approach:

JaeBin Ahn, Era Dabla-Norris, Romain Duval, Bingjie Hu and Lamin Njie
International Monetary Fund

IMF-WB-WTO Joint Trade Workshop
June 29, 2015

## Why...Again?

- Trade and FDI liberalization:
- Essential component of country and global policy agendas
- Welfare gains
- Productivity gains
- Challenges in quantifying gains from trade:
- Various channels
- Cross-country as well as cross-sector heterogeneity
- Interaction with structural factors
- This paper aims to tackle those challenges in country-sector-year set-up
- with a particular focus on the role of resource reallocation

## Previous Theoretical Studies

- Firm-level productivity gains from trade liberalization
- Pro-competition channel
- Scale economies (Helpman and Krugman, 1985)
- Innovation incentives (Aghion et al, 2005)
- cf. Rodrik $(1988,1991)$
- Input variety channel
- Kasahara and Rodrigue, 2008; Gopinath and Neiman, 2014; Halpen, Koren, and Szeidl, 2015
- Technological spillover channel
- Industry-level productivity gains from trade
- Resource reallocation within a sector across firms (e.g., Melitz, 2003)
- Backward and forward linkages (e.g., Rodgriguez-claire, 1996)

## Productivity Gains from Trade Liberalization

- Firm-level TFP gains via output and input market channels will be amplified by the resource reallocation process within each sector

## Previous Empirical Findings

- Country-level studies
- Sachs and Warner (1995, BPEA); Frankel and Romer (1999, AER); Wacziarg and Welch (2008, WBER), etc.
- Carefully controlling endogeneity issues
- Difficult to identify specific channels
- Firm-level studies
- Amiti and Konings (2007, AER); Fernandes (2007, JIE); Topalova and Khandelwal (2011, ReStat)
- Indonesia; Colombia; India
- Separately identify output and input market effects
- Limited analysis of the role of resource reallocation

## Contribution

- Building a unique, comprehensive database of tariff rates
- Incorporate various types of preferential rates beyond MFN rates
- Estimating output and input market channels separately
- Study relationship between output and input tariffs
- Explore interactions with structural factors across countries or country-sectors
- Investigating complementarities between trade and FDI liberalization
- Tariff and non tariff barriers; Trade in goods and services
- Policy simulations from potential reforms (not today)

## Preview of Main Findings

- Dominant input market channels:
- Complementarity between output and input tariffs
- Stronger effect in more flexible economies:
- Labor market flexibility
- Product market regulation
- Complementarity between tariff and FDI regulations:
- Input (output) market channels stronger as FDI regulations are weaker in input (output) markets

## DATA

- Sector-level TFP data from EU KLEMS and World KLEMS
- 17 countries with up to 18 sectors over 23 years
- Tariff data from TRAINS/WITS
- Comprehensive tariff information
- MFN, GSP, RTA, PTA, bilateral preferential rates, etc
- Trade data from UN Comtrade
- Other country- or country-sector level data on the market flexibility
- Employment Protection Index, Product Market Regulation Index, FDI restrictiveness index (OECD).

## Tariff Rate Data Construction

- Comprehensive measure at the product level

$$
\tau_{t}^{i, g}=\sum_{j}^{N^{\text {MRN }}} w_{i j}^{g} M F N_{t}^{i j, g}+\sum_{j}^{N^{\text {perf }}} w_{i j}^{g} P R E F_{t}^{i j, g}+\sum_{j}^{N_{i j}^{\text {pomMN }}} w_{i j}^{g} N O N M F N_{t}^{i j, g}
$$

- Raw data at HS8-10 level from TRAINS/WITS
- weights from initial year's bilateral HS6 trade data
- Aggregate up to 2 digit ISIC sector level (Output tariff)
- weights from initial year's aggregate HS6 trade data
- Incorporate IO tables (Input tariff)

$$
\tau_{t, i, \text { ipput }}^{i, j}=\sum_{k} \alpha_{j k}^{i} k_{t, \text { output }}^{i, k},
$$

where $\alpha_{j k}^{i}$ is the share of imported inputs from sector $k$ in total inputs used in sector $j$

## MFN vs Effective Tariff

- The effective tariff measure tends to be lower and more volatile than the simple average of MFN rates
- By accounting for other preferential rates

## MFN vs Effective Tariff

- The effective tariff measure tends to be lower and more volatile than the simple average of MFN rates
- By accounting for other preferential rates

## The Evolution of Tariff Rates

- Relatively little variation among advanced countries
- Potential issue with country-level study

## The Evolution of Tariff Rates

- Substantial variation across sectors even among EU countries
- Will be exploited along with variation in TFP growth

## Empirical Strategy

- Baseline specification
$\ln T F P_{i s t}=\beta E P R_{i s t-j}+\gamma$ InputTariff $_{\text {ist }-j}+\delta\left(E P R_{i s t-j} \times\right.$ InputTariff $\left._{\text {ist }-j}\right)+F E_{i s}+F E_{i t}+\varepsilon_{i s t}$, where $E P R=\frac{\text { OutputTariff }_{\text {ist }-j}-\text { InputTariff }_{\text {ist }-j}}{1-(\text { Input } / V A)_{i s}}$
- Introducing interaction terms with other structural measures
- Identification strategy
- Aghion et al (2008, AER): state-industry level delicensing in India
- Productivity effects of delicensing
- Variation in labor market institutions across states

## Output vs Input Tariff

Output and Input Tariff
(In deviation from country-sector and country-year average)

- Strong correlation between output and input tariff
- But not enough to generate collinearity concerns

## TFP and Tariff: A Snap Shot

- Negative correlation between TFP and Tariff
- Stronger relationship in more flexible labor market countries

## Regression: Baseline with Complementarity

| Dependent variable: | $\ln ($ TFP)ist |  |  |  |
| :---: | :---: | :---: | :---: | :---: |

Standard errors in parentheses are clustered at the country-year level. Significance: * 10 percent; ** 5 percent; *** 1 percent.

- One s.d decline in effective input tariffs (-1.4\%) raises TFP by around 7\%, when EPR is at median level ( 0.6 ; U.S. electrical equipment)

## Regression: Baseline with MFN Rates

| FDI Regulation |  | (0.246) | -0.249 |
| EPRist-3x |  | -0.012** | -0.004 |
| Effective Input Tariffist-3× |  | (0.005) | (0.003) |
| FDI Regulation |  |  |  |
| Country-sector FE | Yes | Yes | Yes |
| Country-year FE | Yes | Yes | Yes |
| Obs | 2,796 | 2,439 | 2,439 |
| (Adj)R squared | 0.723 | 0.723 | 0.723 |

Standard errors in parentheses are clustered at the country-year level . Significance: * 10 percent; ** 5 percent; *** 1 percent.

- Input (output) market channels stronger as FDI regulations are weaker in input (output) markets

## Interim Summary and Policy Implications

- Dominant input market channels:
- Targeted trade policy design
- Stronger effect in more flexible economies:
- Structural reforms to maximize gains from trade liberalization
- Complementarity between tariff and FDI regulations:
- Scrapping non-tariff barriers to maximize gains from trade liberalization

## Extensions

- Country-sector-year varying measures on structural factors
- Extending samples with labor productivity measure
- Checking robustness with labor productivity
- Checking (dis)similarity between advanced and emerging market economies
- Accounting for catch-up dynamics
- Dynamic analysis with sector-level PPP adjustments
- Can trade policies affect the speed of catch-up?
- Policy simulations
- Under hypothetical scenarios of potential reforms
- Advanced back-of-envelope calculations
