One of the main ways that IICA supports Risk Analysis is through the modernization of national services. IICA has worked in this field for over a decade by incorporating Risk Analysis capacities in assessment tools, including the Common Vision, Evaluation and Action (CVEA) Tool (2003), Performance Vision and Strategy (PVS) for National Veterinary Services (OIE-IICA, 2004), PVS for National Plant Protection Organizations (2005), and PVS for National Food Safety Services (IICA-PAHO, 2005). PVS tools help countries establish and improve the performance of their national services responsible for agricultural health and food safety, create a common vision of the future performance of those services among the public and private sectors, and set strategic planning priorities. Since its development, the PVS for National Food Safety Services has been applied in 10 countries; the PVS for NPPOs has been applied in 12 countries; and the PVS National Veterinary Services in five countries. In addition to directing specific trainings to address needs identified during PVS assessments, application of these tools has helped IICA identify specific challenges and opportunities related to capacity, relevance, and sustainability of Risk Analysis units within the Americas.
