COMPARISON OF THE STRUCTURE OF THE STATISTICAL AND LEGAL TARIFF CLASSIFICATIONS FOR NORWAY

Technical Note by the Secretariat

At several meetings of the Working Party on the Tariff Study, representatives of the Scandinavian countries drew the attention of the members of the Group to the distortions in the basic documentation for the tariff study due to the use of the statistical instead of the legal tariff classification in the cases of Finland, Norway and Sweden.

With the help of the Norwegian authorities, the secretariat made a comparison of tariff averages and frequency distributions of tariff lines according to the level of duties by industrial product categories based on Norway's:

- (i) statistical nomenclature, and
- (ii) legal tariff nomenclature.

The data used are based on the customs tariff as of 1 April 1972 and most-favoured-nation imports in 1972. The definitions of industrial product categories and sub-categories, the method of calculation of tariff averages and other explanations concerning the duty rates and the import data are given in the Explanatory Notes published at the beginning of the corresponding volume of the Basic Documentation for the tariff study recently circulated to delegations.

Although differences exist between the tariff of Norway and the tariffs of the other Scandinavian countries, it can be assumed that similar distortions exist in the tariff study data published for Sweden and Finland.

Presentation

The comparison has been carried out for all industrial products, for the three processing stages and for the categories and sub-categories of industrial products. The comparisons of the frequency distributions are only reported at the category level, tables concerning sub-categories of industrial products are available in the secretariat.

The first series of tables (Part 1) compares tariff averages Nos. 1 and 2^{1/} for all most-favoured-nation tariff lines, i.e., duty-free and dutiable lines, and for most-favoured-nation dutiable lines only.

The second series of tables (Part 2) compares the simple frequency distribution (by duty ranges) of all tariff lines and of dutiable lines only. Finally, the third series (Part 3) compares the cumulative frequency distributions with respect to all tariff lines. In tables appearing in Part 2 and Part 3 the left column refers to frequency distributions based on the legal tariff classification and the next column to that based on the statistical classification. The right column refers to most-favoured-nation imports. The line "total" in tables of Part 2 indicates the number of tariff lines in each category and the value of most-favoured-nation imports in US\$ million. The simple frequency distributions (in percentages) shown below are based on these totals.

^{1/} The tariff averages Nos. 3 and 4 being weighted by trade are not affected by the differences in the structure of the two nomenclatures.

Conclusions from the Comparison of the Two Classifications

For all industrial products (category 99), the statistical classification contains 3,938 tariff lines, which represent more than twice the number of tariff lines in the legal classification (1,725 lines). The proportion is similar for semi-manufactures (category 99.02: 1,185 lines compared with 524) and for finished manufactures (category 99.03: 2,518 compared with 1,111), and is slightly higher for raw materials (category 99.01: 235 lines compared with 90).

The tables in Part 2 show that the simple frequency distributions of tariff lines by level of duty are different for the two classifications. For all industrial products the proportion of duty-free lines is practically the same for the two nomenclatures (26.3 and 26.6 per cent). For the categories corresponding to stages of processing, the proportion is higher in the legal classification for finished manufactures (16.0 compared with 13.5 per cent) and lower for raw materials (85.6 compared with 89.8 per cent) and semi-manufactures (37.8 compared with 42.0 per cent).

In the range of duties between 0.1 and 15.0 per cent, the frequency of tariff lines is always higher in the legal classification: 60.4 compared with 55.6 per cent for all industrial products, 13.3 compared with 9.8 per cent for raw materials, 52.7 compared with 46.0 per cent for semi-manufactures and 67.9 compared with 64.4 per cent for finished manufactures. With the exception of raw materials, the proportion of tariff lines with duties over 15.0 per cent is lower in the legal classification: 13.3 compared with 17.8 per cent for all products, 9.5 compared with 12.0 per cent for semi-manufactures and 16.1 compared with 22.1 per cent for finished manufactures.

Again with the exception of raw materials similar differences can be found in the simple frequency distributions of dutiable tariff lines. For these products, the proportion of lines subject to duties of between 0.1 and 15.0 per cent is lower in the legal classification (92.3 per cent) than in the statistical classification (95.8 per cent).

Tariff averages shown in the tables appearing in Part 1 reflect the same structure in each classification. Thus, for all industrial products, the No. 1 averages calculated on all tariff lines and on dutiable lines only, are higher according to the statistical classification (8.3 and 11.3 per cent respectively) than according to the legal classification (7.7 and 10.4 per cent). For raw materials and semi-manufactures, as previously noted, duty-free tariff lines are more detailed in the statistical classification than in the legal classification.

Thus, the No. 1 average calculated on all tariff lines is lower for the statistical classification in the case of categories 99.01 (0.7 compared with 1.0 per cent) and 99.02 (6.4 compared with 6.5 per cent). On the other hand, for dutiable lines only, the No. 1 average for semi-manufactures is higher for the statistical classification, due to the larger proportion of lines with duty rates over 15 per cent in that classification. Finally for finished manufactures, the concentration of duty-free lines is higher in the legal classification while the proportion of dutiable lines with rates over 15 per cent is higher in the statistical classification. This explains why the two No. 1 averages for finished manufactures, calculated on all lines and on dutiable lines only, are lower in the legal classification (8.8 and 10.5 per cent respectively) than for the statistical classification (10.0 and 11.5 per cent).

Concerning averages No. 2 calculated on dutiable lines, it can be seen that for these large categories, there are no significant differences between averages calculated on the basis of the statistical classification and on the basis of the legal classification. For No. 2 averages calculated on all lines, the table shows a slight difference for finished manufactures; that difference of course, being reflected at the level of "all industrial products". It was previously noted that the frequency of duty-free tariff lines in the finished manufactures category was generally higher in the legal classification than in the statistical classification. However, for certain BTN headings, the number of duty-free lines is higher in the statistical classification and consequently the simple tariff average for these headings is lower when based on that classification. Some of these BTN headings are important in world trade and the bias that can be discerned in these cases is reflected at both the level of certain categories or sub-categories (13.01, 13.03) and at the level of "all industrial products". This phenomenon also explains the significant gap between averages No. 1 and No. 2 (calculated from the statistical classification) for all products and for finished manufactures.

Part 1/Partie 1

NORWAY - NORVEGE
